Circuit diagram of a 4-bit ripple carry adder is shown below. Ripple carry adder. Sum out S_0 and carry out C_{out} of the Full Adder 1 is valid only after the propagation delay of Full Adder 1. In the same way, Sum out S_3 of the Full Adder 4 is valid only after the joint propagation delays of Full Adder 1 to Full Adder 4.

The Main operation of Ripple Carry Adder is it ripple the each carry output to carry input of next single bit addition. Each single bit addition is performed with full Adder operation (A, B, Cin) input and (Sum, Cout) output. The 4-bit Ripple Carry Adder VHDL Code can be Easily Constructed by Port Mapping 4 Full Adder.

The below diagram represents the 4-bit ripple-carry adder. In this adder, four full adders are connected in cascade. Co is the carry input bit and it is zero always. When this input carry 'Co' is applied to the two input sequences A1 A2 A3 A4 and B1 B2 B3 B4 then output represented with S1 S2 S3 S4 and output carry C4.

Figure 2 shows the Verilog module of a 4-bit carry ripple adder. A and B are the two 4-bit input ports which is used to read in the two 4-bit numbers that are to be summed up. The 1-bit carry-in input port Cin is used to read in a carry bit, if another instance of the ripple carry adder is cascaded towards lesser significant stage.

The team was able to reach a 4-bit ripple carry adder that has delay of 1.22 ns with 0.6 uW power consumption (measured at 10 MHz), with 109 transistors. In the re-evaluation phase, the team was able to further improve this to reach 0.99 ns delay with 0.25 uW power consumption

4-Bit Adder Project Report

Fig 2 - Ripple carry adder Stages. In 4 bit adder, the time delay for a valid output is the sum of time delay of 4 full adders, if there is an 'n' bit adder, than the time delay will be the sum of time delay of 'n' full adders. It means, higher the bit size of the numbers, the late the answer we will get.

Similarly, in the Ripple Carry Adder, the Carry bit 'ripples' forward into the system. To begin with, when we consider a 4-bit ripple carry adder, we see that the augend and the addend are readily available. All that is left for the full adder to begin working is the input carry. This carry is given as an input to the first full adder.

Figure 3 shows the interconnection of four full adder (FA) circuitsto provide a 4-bit ripple carry adder. Notice from Figure 3 that the input is from the right side because the first cell traditionally represents the least significant bit (LSB). Bits and in the figure represent the least significant bits of the numbers to be added.
