Many applications of regression analysis involve both independent/predictor and dependent/response variables that are time series, that mean, the variables are recorded at time sequence. The assumption of uncorrelated or independent errors that is typically made for regression data that is not time-dependent is usually not appropriate for time ...

Time Series Analysis and Its Applicability Time Series analysis is "an ordered sequence of values of a variable at equally spaced time intervals." It is used to understand the determining factors and structure behind the observed data, choose a model to forecast, thereby leading to better decision making.
