It follows a fairly straightforward process to do so: The fuel exits the fuel tank via the fuel pump. It travels through fuel lines towards the engine. The fuel pressure regulator constricts the flow of fuel and only lets a calculated amount through to the injectors. The fuel pressure regulator ...

While the carburetted system fetches low-pressure fuel from the fuel tank, these mechanical fuel injector systems pump a high-pressure fuel from the fuel tank, which is the basic principle of how the mechanical fuel injectors work. Once pumped from the fuel tank, the fuel then enters the

accumulator. You can think of an accumulator as a buffer for the temporary storage of the fuel. Then comes in play the metering control unit of the system. Its job is to distribute the fuel to the cylinders.
